METHOD FOR ENHANCING ANIMAL GROWTH AND CELL PROLIFERATION BY ELIMINATION OF THE CYCLIN-DEPENDENT KINASE INHIBITOR FUNCTION OF P27^{KEPL}

Abstract of the Disclosure

This invention provides a recombinant non-human animal lacking the cyclin-dependent kinase inhibitor function of $p27^{Kipl}$ and the method for producing the same. invention also provides a method for increasing the proliferation of the thymic T-cells by treating the thymic T-cells to eliminate the cyclin-dependent inhibition function of $p27^{Kip1}$. This invention also provides a method for increasing the proliferation of hematopoietic cells which comprises treating hematopoietic cells to eliminate the cyclin-dependent kinase inhibitor function of $p27^{Kip1}$, thereby increasing the proliferation of the hematopoietic cells. invention further provides a method for alleviating symptoms of an AIDS patient comprising steps of: a) collecting the lymphocytes or other cells from an AIDS patient; b) treating the collected cells to eliminate the cyclin-dependent kinase inhibition function of $p27^{\text{Kipl}}$; and c) re-introducing the treated cells to the AIDS patient.
